

Digital Wellness Analyzer

AI-powered digital behavior report - classification, explainability, forecasting, clustering, and personalized actions.

Profile	Judge Demo	Digital Wellness Status	Needs attention
Model Risk Score	100.0%	Behavior Cluster	Cluster 2
Projected Weekend Use	11.4 hours	Next Check-in	2026-08-23 15:40

Classification Chart

Reported Digital Time

Why the Model Reached This Result

Feature	SHAP	Direction
Daily Screen Time Hours	+0.3609	increases model risk
Weekend Screen Time	+0.1727	increases model risk
Social Media Hours	-0.0526	decreases model risk
Notifications Per Day	+0.0053	increases model risk
Age	+0.0038	increases model risk

Personalized Recommendations

- 1. Daily screen time is not among the highest values in the reference dataset, but it is a strong driver of this model result. Review which screen activities are essential and replace one low-value session with an offline activity.
- 2. Weekend screen time is relatively high and contributes to the model result. Schedule a specific offline block for movement, social contact, learning, or a hobby.
- 3. Notification volume is high relative to the reference dataset. Turn off non-essential alerts and batch communication into planned check-in windows when possible.

Smart Activity Replacement

Role: Student | Available time: 30 minutes | Goal: Reduce social media | Preference: Physical | Peak scrolling time: Evening

- Physical:** Take a brisk walk without holding your phone.
- Physical:** Do a short mobility or stretching session.
- Physical:** Walk around campus or your neighborhood.

Focus Software Suggestions

Tool	Best for	Why suggested
one sec	Interrupting automatic social-media opening	Adds a deliberate pause before distracting app use, which can help users notice automatic scrolling habits.
Forest	Focus sessions and intentional phone-free time	Uses a visual focus timer to encourage staying with one task instead of repeatedly checking distracting apps.
Freedom	Blocking distracting apps and websites across devices	Useful when the main problem is access to distracting websites or apps during study and work sessions.

Today's Challenge

Replace 30 minutes of passive social-media use with this activity: Take a brisk walk without holding your phone.

Important Note

This is a machine-learning digital wellness aid, not a medical diagnosis. Model scores and percentiles are model- and dataset-relative.
